

CloudDesk 4.6 — Engineering & Product Release Package

Hard-test source document for an AI documentation workflow. It deliberately combines product facts, API details, engineering notes, security constraints, metrics, limitations, and claims that require verification.

1. Release Overview

Product: CloudDesk Analytics Platform
Release: 4.6.0
Release date: September 18, 2026
Audience: business analysts, operations teams, data administrators
Change type: feature release with API and dashboard updates

CloudDesk 4.6 introduces saved dashboard filters, improved CSV export controls, a new dashboard activity endpoint, and changes to workspace-level permissions. Engineering also reports internal performance improvements.

2. Customer-Facing Changes

Area	Change	Availability
Dashboard filters	Users can save named filter configurations and apply them later.	All paid workspaces
CSV export	Export dialogs expose selected columns and a row-limit setting.	All workspaces
Dashboard activity	API consumers can retrieve recent dashboard activity.	API access enabled
Workspace permissions	A permission controls who can share dashboards outside a workspace.	Workspace admins
Query performance	Engineering reports lower median dashboard query latency after query-planner changes reported internally	

3. Saved Dashboard Filters

Users can save a filter configuration with a name and reapply it from the dashboard filter menu. Saved filters are associated with the dashboard rather than the user's global profile.

Example: A regional operations analyst saves “North Region — Open Orders” containing Region=North and Status=Open.
Known limitation: The release notes do not specify a maximum number of saved filters per dashboard or whether saved filters can be shared between users.

4. CSV Export Changes

The export dialog allows users to choose visible columns and configure a row limit. The source does not establish whether export is synchronous, queued, or subject to a workspace-specific maximum file size.

5. API: Dashboard Activity

New endpoint:

```
GET /api/v2/dashboards/{dashboard_id}/activity?limit=50
```

Example response:

```
{
  "dashboard_id": "db_2048",
  "events": [
    {
      "type": "filter_saved",
      "actor": "u_71",
      "timestamp": "2026-09-18T11:42:10Z"
    },
    {
      "type": "dashboard_shared",
      "actor": "u_19",
      "timestamp": "2026-09-18T11:39:02Z"
    }
  ]
}
```

Authentication uses the existing workspace bearer-token mechanism. The source does not document pagination style or the retention period for activity events.

6. Permission Model

Permission	Workspace Admin	Analyst	Viewer
Create dashboard	Yes	Yes	No
Share dashboard externally	Yes	No	No
Save dashboard filter	Yes	Yes	No
Export CSV	Yes	Yes	No
View dashboard activity	Yes	Yes	Yes

Security note: external dashboard sharing is explicitly restricted to workspace administrators in this release package. Do not infer that API tokens themselves have administrator privileges.

7. Engineering Notes

The query-planner update changes how dashboard filters are pushed into the data-access layer. The implementation team reports that median dashboard query time decreased by approximately 27% in an internal benchmark. Benchmark population, hardware, dataset size, query mix, and baseline version are not included, so this figure should not be presented as a universal customer performance guarantee.

The release also adds request-level tracing around dashboard activity retrieval. Trace identifiers are included in internal service logs. No customer-facing tracing interface is documented.

8. Security and Privacy Notes

- Dashboard activity records may contain actor identifiers and timestamps.
- External sharing is controlled by a workspace permission.
- Bearer authentication is required for the dashboard activity endpoint.
- The source does not establish whether activity data is encrypted separately from existing platform storage.
- The source does not establish a specific retention period for activity records.

9. Migration / Compatibility

Existing dashboards continue to load after upgrading to 4.6. Saved filters are additive. API consumers using v1 endpoints are not documented as requiring migration. No formal v1 deprecation date is provided.

10. Verification Checklist

Check	Expected evidence
Saved filter creation	Named filter can be saved and reapplied
CSV export	Selected columns and row limit appear in downloaded CSV
Activity API	Authenticated request returns dashboard activity events
External sharing	Non-admin cannot perform external sharing
Performance claim	27% improvement is treated as an internal benchmark, not a universal guarantee

11. Claims Requiring Verification

- The platform supports real-time streaming dashboards.
- AI-generated dashboards are available to customers.
- Dashboard activity is retained indefinitely.

- CSV exports have no maximum file size.
- The query-planner update guarantees a 27% performance improvement for every customer.
- Saved filters can be shared across users.

12. Source Metadata
